

# Tone in Otomanguean Languages

## IntoSpan 2014

John Kingston

Department of Linguistics  
University of Massachusetts, Amherst  
[jkingston@linguist.umass.edu](mailto:jkingston@linguist.umass.edu)

October 11, 2014

## 1 Challenges to typological expectations about tone:

- a Rising without falling tones,
- b Very numerous tone contrasts: Chinantec, Chatino;

## 2 Phonology of tone:

- a Tone sandhi in Chatino of San Juan Quiahije,
- b Tone-laryngeal constraints in Triqui languages,
- c Variable influence of \*ʔ in sound change;

## 3 Phonetics of tone:

- a Numerous contrasts in Chinanteco of San Antonio Analco and San Juan Quiotepec,
- b Classifying tones automatically;

## 4 Representing numerous tone contrasts phonologically.

# Classification and typology

## ① Eastern:

- a Oto-Pamean: 3 H:L:L-H,
- b Tlapanecan: 9 (probably reducible to 3 H:M:L),
- c Chinantecan: 12 and counting (and differing between languages);

## ② Western:

- a Popolocan: 4 H:HM:LM:L,
- b Mixtecan:
  - ⊙ Mixtec: 3 H:M:L or H:0:L,
  - ⊙ Triqui: 8-10+ (later);
- c Zapotecan:

→ [Lambert 1977: 111-112](#)

→ [Dobson 1970: 15](#) and counting (and differing between languages);

# Tone sandhi in Chatino of San Juan Quiahije: Sketch of an analysis

## ① Floating tones:

- a Super-Hs = +0:  $H_2 = H+0$ ,  $H-L = H-L+0$ ,  $L-0 = L-0+0$ ,
- b +H:  $M = M+H$ ,
- c Associate to following toneless syllables,
- d +0s associate to source if following syllable is specified for tone,
- e +Hs disappear before specified syllables;

## ② Insertions on following toneless syllables:

- a H1, M+, M-0, M-L1, 0-L insert M-L,
- b Alternatively, the sandhi tone is uniformly L, and in:
  - i H M-L, M+ M-L, M-0 M-L, the apparent M is transitional/coarticulatory,
  - ii M-L1 M-L, 0-L M-L, the M is epenthetic and demarcative,
- c M-L2 inserts M-H – alternatively, the sandhi tone is H, and the apparent M is transitional/coarticulatory;

## ③ Toneless syllables default to L otherwise.

# Coda laryngeal–tone constraints in Triqui: Generalizations

## ① Rising tones:

- a Itunyoso (35, 13) and Chicahuaxtla (23, 13) only –h,
- b Copala (13) only –ʔ;

## ② Falling tones:

- a Itunyoso only 32 –h, 43, 31 only when no –h, –ʔ,
- b Chicahuaxtla 32, 31, 21 –ʔ, 42, 32, 21 –h,
- c Copala 32 only –h;

③ Itunyoso: –h permits rising F<sub>0</sub>, –ʔ blocks any F<sub>0</sub> change;

④ Copala: –ʔ permits rising F<sub>0</sub>, –h permits falling F<sub>0</sub>;

⑤ Chicahuaxtla: –h, –ʔ permit rising, falling F<sub>0</sub> – only one rising (23) and one falling (43) tone are absent –ʔ and only one falling (31) tone –h;

⑥ Cf. Athabaskan tonogenesis (Krauss, 2005; Kingston, 2005).

# Estimate of number of tones in Chinanteco of San Juan Quiotepec

- ① 5+1 level,
- ② 3 or 4 falling,
- ③ 3 or 4 rising,
- ④ 2 concave,
- ⑤ Total: 13-15.
- ⑥ Cf. Castillo (2012), Castellanos (2014): 6 levels, 3 falling, 3 rising, plus some number of complex (concave, convex) tones.

## Following Shosted, Wu, and Goldrich (2104)

- 1 Single male speaker, Chinanteco of San Juan Quiotepec,
- 2 141 lexical items,  $\approx 3$  repetitions in isolation each, 444 utterances altogether,
- 3 F0 at all 10% points of rime,
- 4 15 hypothesized tone categories (see above),
- 5 Principal components analysis of unnormalized F0 contours (cf. Shosted, et al., who normalized),
- 6 Discriminant analysis to predict test subset from training subset,
- 7 Principal components analysis of derived measures.

# Discriminant analysis: Predicting test classification from training

- 1 Repeatedly divided data into non-overlapping training and test halves,
- 2 Extracted principal components from training and test halves separately,
- 3 Used them as input to discriminant analysis on training half,
- 4 Used results to predict classification into *a priori* tones in terms of principal components extracted from the test half,
- 5 Result: Roughly half the test set's tones predicted correctly,
- 6 For 15 *a priori* categories, an extraordinarily successful result by a binomial test.

Summary

Acknowledgments

- 1 Otomanguean languages' tone systems are quite varied;
- 2 Typological challenges:
  - a Rising tone favored over falling;
  - b Too many contrasting tones;
- 3 Tone sandhi is both concrete and arbitrary, is a partial source of multiplying contrasts, but only a partial one;
- 4 Laryngeals interact differently with tone across closely related languages synchronically and diachronically;
- 5 While it's possible to classify tones physically with few dimensions, translation to features is still not obvious.
